Stable release

Ledgerline Server 4.2.0 release notes

Released 14 October 2026 · supersedes 4.1.3

Ledgerline Server 4.2.0 introduces scheduled reconciliation, faster ledger exports and stricter TLS defaults. Most installations can upgrade in place in under fifteen minutes, but one configuration key has been renamed.

Highlights

- Reconciliation jobs can now run on a fixed interval instead of only on demand.
- CSV and Parquet exports of large ledgers are about three times faster.
- TLS 1.3 is the default minimum version for the HTTP listener.
- The audit log records the client certificate fingerprint for every write.

Changes in this release

Ticket	Type	Summary
LL-2291	Feature	Scheduled reconciliation with `jobs.reconcile_interval`
LL-2305	Feature	Parquet export format for ledgers and journals
LL-2318	Performance	Streaming writer for exports; memory use no longer grows with ledger size
LL-2322	Security	Default `tls_min_version` raised from 1.2 to 1.3
LL-2340	Fix	Rounding error in multi-currency balances with more than four decimals
LL-2347	Fix	Health endpoint reported ready before migrations had finished
LL-2351	Change	Configuration key `reconcile_every` renamed to `reconcile_interval`
LL-2356	Deprecation	The XML export endpoint will be removed in 5.0

Breaking changes

The server refuses to start if the old key `reconcile_every` is still present in the configuration file. Rename it before restarting, as shown in step 2 of the runbook.

> Clients that only support TLS 1.2 will fail to connect after the upgrade unless `tls_min_version` is set back to "1.2".

Upgrade runbook

Run these steps on each application node in turn. A single-node installation will be unavailable for the duration of steps 1 to 3.

Step 1: Back up and stop the service

```
$ ledgerctl backup create --label pre-4.2 --verify
$ sudo systemctl stop ledgerline
$ sudo apt-get install ledgerline-server=4.2.0-1
```

Step 2: Update the configuration

Edit the server configuration and rename the reconciliation key. The other keys below are shown for context.

```
# /etc/ledgerline/server.yaml
database:
  url: postgres://ledger@db01:5432/ledger
  pool_size: 20
http:
  listen: 0.0.0.0:8443
  tls_min_version: "1.3"
jobs:
  reconcile_interval: 15m   # was reconcile_every in 4.1
```

Step 3: Migrate and start

```
$ ledgerctl migrate --check
$ ledgerctl migrate --apply
$ sudo systemctl start ledgerline
$ curl -fsS https://localhost:8443/healthz
{"status":"ready","version":"4.2.0"}
```

The migration adds two indexes to the journal table and takes about one minute per ten million journal lines.

Rollback

If the health check fails, stop the service, reinstall version 4.1.3 and restore the backup taken in step 1. Do not run the 4.1 server against a database that has been migrated to 4.2.

Supported upgrade paths

From version	Direct upgrade	Notes
4.1.x	Yes	Follow this runbook.
4.0.x	Yes	Run `ledgerctl migrate --apply` twice; the first run upgrades to the 4.1 schema.
3.x	No	Upgrade to 4.0.6 first.
