Tessellate Sync 4.2 Release Notes

Released 14 October 2026 · build 4.2.0.1187

Highlights

Version 4.2 introduces selective sync rules and a command-line report of sync conflicts. It also makes the first sync of large folders up to three times faster.

This release is a free update for all customers with an active subscription.

New features

Selective sync rules

You can now choose which files are synced by listing include and exclude patterns in a rules file. Patterns are matched relative to the root of the synced folder:

```
# .tessellate/rules.yaml
sync:
  include:
    - "projects/**"
    - "invoices/2026/*.pdf"
  exclude:
    - "**/node_modules/**"
    - "*.tmp"
  max_file_size: 2GB
```

Conflict report

The new `tess conflicts` command lists every file that changed on both sides, with the decision the client took:

```
$ tess conflicts --since 7d --format table
PATH                        LOCAL     REMOTE    ACTION
projects/atlas/plan.md      10:42:07  10:41:55  keep both
invoices/2026/0918.pdf      09:03:12  09:05:40  remote wins
```

Improvements

- Faster first sync on large folders:
  - the initial scan now runs on four threads by default;
  - unchanged files are skipped by size and modification time before hashing.
- The tray icon shows the number of files still waiting to upload.
- Proxy support:
  - authenticated HTTP proxies are supported;
  - the proxy can be read from the operating system settings.

Fixed issues

- TS-2291: renaming a folder while offline no longer duplicates its contents.
- TS-2304: file names with trailing spaces are synced on all platforms.
- TS-2317: the client no longer stops when the disk is almost full; it pauses and warns instead.
- TS-2342: shared links keep their expiry date after the file is edited.

Compatibility

Platform	Minimum version	Notes
Windows	10 (22H2)	ARM64 build available
macOS	13 Ventura	Universal binary
Linux	glibc 2.31	AppImage and .deb packages
Server	4.0	Clients 4.2 refuse servers older than 4.0

Deprecated settings

The following settings still work in 4.2 but print a warning at start-up.

Setting	Replacement	Removed in
`sync.ignore_file`	`sync.exclude` in rules.yaml	5.0
`net.legacy_tls`	none; TLS 1.2 or later is required	4.3
`ui.compact_tray`	`ui.tray_style: compact`	5.0

Upgrading

1. Close the client on every device that uses the account.
2. Install version 4.2 over the existing installation; settings are kept.
3. Start the client and move any `sync.ignore_file` patterns into `rules.yaml`.

If you manage clients centrally, the MSI package accepts the same command-line options as version 4.1.
