Release Notes for the Tessel Build Tool 3.2

Version 3.2 changes how configuration files are loaded. Errors now name the file that could not be read, which makes broken setups much easier to diagnose.

Loading the configuration

```
func loadConfig(path string) (*Config, error) {
    data, err := os.ReadFile(path)
    if err != nil {
        return nil, fmt.Errorf("read %s: %w", path, err)
    }
    var cfg Config
    if err := json.Unmarshal(data, &cfg); err != nil {
        return nil, err
    }
    return &cfg, nil
}
```

Upgrading

Existing installations can be upgraded in place with the built-in update command.

```
$ tessel --version
tessel 3.1.4
$ tessel self-update --channel stable
Downloading tessel 3.2.0 ... done
Verifying signature ... ok
$ tessel --version
tessel 3.2.0
```

> *A build tool should be boring in the best sense of the word. It should do the same thing every time, and tell you clearly when it cannot.*
